L5      ANSWER 1 OF 176  USPATFULL on STN
TI      Methods and systems for predicting cancer outcome

L5      ANSWER 2 OF 176  USPATFULL on STN
TI      Methods for predicting cancer outcome and gene signatures for use
        therein

L5      ANSWER 3 OF 176  USPATFULL on STN
TI      Methods for indentifying compounds that modulate an enzyme involved in
        riboflavin metabolism in a pathogenic microorganism

L5      ANSWER 4 OF 176  USPATFULL on STN
TI      Methods for indentifying compounds that modulate an enzyme involved in
        reductive carboxylation in a pathogenic microorganism

L5      ANSWER 5 OF 176  USPATFULL on STN
TI      Methods for indentifying compounds that modulate an enzyme involved in
        thiamine metabolism in a pathogenic microorganism

L5      ANSWER 6 OF 176  USPATFULL on STN
TI      Pharmaceutical compositions

L5      ANSWER 7 OF 176  USPATFULL on STN
TI      Inhibitors of nucleoside phosphorylases and nucleosidases

L5      ANSWER 8 OF 176  USPATFULL on STN
TI      Feedback-resistant homoserine transsuccinylases having a modified c
        terminus

L5      ANSWER 9 OF 176  USPATFULL on STN
TI      Methods for indentifying compounds that modulate an enzyme in the
        coenzyme a biosynthetic pathway in a pathogenic microorganism

L5      ANSWER 10 OF 176  USPATFULL on STN
TI      Nanomachine compositions and methods of use

L5      ANSWER 11 OF 176  USPATFULL on STN
TI      Methods of identifying patients at risk of developing encephalitis
        following immunotherapy for Alzheimer's disease

L5      ANSWER 12 OF 176  USPATFULL on STN
TI      Complete genome and protein sequence of the hyperthermophile
        methanopyrus kandleri av19 and monophyly of archael methanogens and
        methods of use thereof

L5      ANSWER 13 OF 176  USPATFULL on STN
TI      Method for the identification and treatment of pathogenic microorganism
        infections by inhibiting one or more enzymes in an essential metabolic

```

pathway

- L5 ANSWER 14 OF 176 USPATFULL on STN
TI Novel full length cDNA
- L5 ANSWER 15 OF 176 USPATFULL on STN
TI Nucleic acid sequences relating to *Bacteroides fragilis* for diagnostics and therapeutics
- L5 ANSWER 16 OF 176 USPATFULL on STN
TI Nucleic acid and amino acid sequences relating to *Staphylococcus epidermidis* for diagnostics and therapeutics
- L5 ANSWER 17 OF 176 Elsevier BIOBASE COPYRIGHT 2006 Elsevier Science B.V. on STN DUPLICATE
TI Identification of fungal sphingolipid C9-methyltransferases by phylogenetic profiling
- L5 ANSWER 18 OF 176 Elsevier BIOBASE COPYRIGHT 2006 Elsevier Science B.V. on STN
TI In vivo hydrolysis of S-adenosylmethionine induces the met regulon of *Escherichia coli*
- L5 ANSWER 19 OF 176 LIFESCI COPYRIGHT 2006 CSA on STN
TI In vivo hydrolysis of S-adenosylmethionine induces the met regulon of *Escherichia coli*
- L5 ANSWER 20 OF 176 BIOSIS COPYRIGHT (c) 2006 The Thomson Corporation on STN
TI Assessment of inhibitors of S-adenosylmethionine synthesis discovered by computational docking.
- L5 ANSWER 21 OF 176 Elsevier BIOBASE COPYRIGHT 2006 Elsevier Science B.V. on STN
TI The Structure of the RNA m.sup.5C Methyltransferase YebU from *Escherichia coli* Reveals a C-terminal RNA-recruiting PUA Domain
- L5 ANSWER 22 OF 176 MEDLINE on STN
TI Molecular evolution of AdoMet synthetase by DNA recombination with a novel separate-mixing method.
- L5 ANSWER 23 OF 176 CAPLUS COPYRIGHT 2006 ACS on STN DUPLICATE 2
TI Molecular evolution of adomet synthetase by DNA recombination with a novel Separate-Mixing method
- L5 ANSWER 24 OF 176 Elsevier BIOBASE COPYRIGHT 2006 Elsevier Science B.V. on STN DUPLICATE
TI Characterization of S-adenosylmethionine synthetase from *Streptomyces avermitilis* NRRL8165 and its effect on antibiotic production
- L5 ANSWER 25 OF 176 CAPLUS COPYRIGHT 2006 ACS on STN DUPLICATE 4

AB A method for fermentative production of S-adenosylmethionine (SAM), includes culturing a bacterial strain obtainable from a starting strain and having increased SAM-synthetase activity, compared to the starting strain, in a culture medium, the bacterial strain secreting SAM into the culture medium and the SAM being removed from the culture medium. Thus, the metK gene, encoding methionine adenosyltransferase, was overexpressed in Escherichia coli.

AB Isolated nucleic acid molecules, designated MCT nucleic acid molecules, which encode novel MCT proteins from *Corynebacterium glutamicum* are described. The invention also provides antisense nucleic acid molecules, recombinant expression vectors containing MCT nucleic acid molecules, and host cells into which the expression vectors have been introduced. The invention still further provides isolated MCT proteins, mutated MCT proteins, fusion proteins, antigenic peptides and methods for the improvement of production of a desired compound from *C. glutamicum* based on genetic engineering of MCT genes in this organism.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Deoxycytosine methylase (Dcm) enzyme activity causes mutagenesis in vitro either directly by enzyme-induced deamination of cytosine to uracil in the absence of the Me donor, S-adenosylmethionine (SAM), or indirectly through spontaneous deamination of [5-methyl]cytosine to thymine. Using a Lac reversion assay, we investigated the contribution of the first mechanism to Dcm mutagenesis in vivo by lowering the levels of SAM. Escherichia coli SAM levels were lowered by reducing SAM synthetase activity via the introduction of a metK84 allele or by hydrolyzing SAM using the bacteriophage T3 SAM hydrolase. The metK84 strains exhibited increased C-to-T mutagenesis. Expression of the T3 SAM hydrolase gene, under the control of the arabinose-inducible PBAD promoter, effectively reduced Dcm-mediated genomic DNA methylation. However, increased mutagenesis was not observed until extremely high arabinose concns. were used, and genome methylation at Dcm sites was negligible.

AB The E. coli metK gene codes for the enzyme s-adenosylmethionine synthetase which converts methionine to S-adenosylmethionine (SAM) a major methyl donor of the cell. To see if this gene is essential to E. coli, we used the elegant pK03 gene replacement vector of George Church in cells carrying an intact metK gene on the paraBAD plasmid. This resulted in a 600 bp deletion in metK, confirmed by sequencing across the deletion cloned in pK03. Because this strain allowed for frequent recombination, and because pBAD-metK is expressed at a relatively high rate even in the absence of arabinose, we wished to clone the intact metK gene under the control of a highly-inducible tightly-regulated promoter in a low copy plasmid in a recA- strain. We therefore cloned metK on a p15A construct obtained from Dr. Lutz, under

control of the pLtet promoter, and replaced pbadmetK with this vector. We then transduced this strain with a gene producing the tet repressor, and made it recA- also by transduction. This resulted in a strain of E. coli K12 which carries a 600 bp deletion in the chromosomal metK gene with a plasmid-carried functional metK under the tet promoter. This strain cannot grow on LB unless anhydrotetracycline is added to induce metK transcription. We conclude that metK is an essential gene, and E. coli K12 cannot grow without SAM.

AB The problems inherent in the enzymic and chemical synthesis of S-adenosyl-L-methionine (SAM) led to development of an efficient, simple method for the synthesis of large amts. of labeled SAM. It has previously been reported that the problem of product inhibition of E. coli SAM synthetase encoded by the metK gene was successfully overcome in the presence of sodium p-toluenesulfonate (pTsONa). This research has now been expanded to demonstrate that product inhibition of this enzyme can also be overcome by adding a high concentration of

β -mercaptoethanol (β ME), acetonitrile, or urea. In addition, a recombinant strain of E. coli has been constructed that expresses the yeast SAM synthetase encoded by the sam2 gene. The yeast enzyme does not have the problem of product inhibition seen with the E. coli enzyme. Complete conversion of 10 mM methionine to SAM was achieved in incubations with either the recombinant yeast enzyme and 1 M potassium ion or the E. coli enzyme in the presence of additives such as β ME, acetonitrile, urea, or pTsONa. The recombinant yeast SAM synthetase was used to generate SAM in situ for use in the multi-enzymic synthesis of precorrin 2.

 AB A method of production for production of S-adenosyl-L-methionine (SAM) by
 fermentation

of bacteria is presented. Escherichia coli was transformed with an expression vector containing a nucleic acid sequence coding for rat S-adenosyl-methionine synthetase and an inducible bacteriophage T7 promoter sequence. SAM is a naturally occurring mol., widely distributed throughout body tissues and fluids. It plays a central role in three main metabolic pathways, such as transmethylation, transsulphuration and aminopropylation. SAM is currently used in medical and pharmacol. areas due to its therapeutic potential in liver damage and affective disorders. This method has superior properties with respect to prior approaches to SAM production by fermentation of a microorganism and may have a potential industrial interest as a powerful source of SAM.

AB S-Adenosylmethionine (SAM) is synthesized in vitro by SAM synthetase, which is coded for by the metK gene of E. coli. Since E. coli cells are impermeable to SAM, it has been impossible to obtain mutants which require SAM for growth. The finding that SAM is required for regulating methionine biosynthesis was used to select metK mutants which have the phenotype of resistance to methionine analogs. These mutants show reduced SAM synthesis in vitro, and a lower level of intracellular SAM. However, as all these mutants can grow, without added SAM, the block in SAM synthesis must be incomplete. To try to block SAM synthesis more completely temperature-sensitive metK mutation was combined with a block in the synthesis of cystathionine (metA), a precursor that supports only slow growth because of slow entry. At the nonpermissive temperature for metK, these double mutants could grow on methionine but not on cystathionine, in correlation with the greatly reduced intracellular level of SAM. This result indicates that it is possible to reduce intracellular SAM concns. to levels which are low enough to prevent growth of E. coli. Moreover, since the mutation responsible for the reduction in SAM level is in the metK gene, it is suggested that SAM synthetase is the enzyme which catalyzes SAM biosynthesis in E. coli cells.
